

Day 2, Activity 1

jQuery Practice: CSS

- First, add a script tag linking to the jquery js file. Next, begin a site file (such as day2.js). Make sure it is stored in a /js/ subfolder.
- In your site js file, begin with the jQuery Ready Callback:
`$(document).ready(function() {});`
- Inside the *ready function*:
- **For each of the below targets, create a variable for that factory target:**
 - Targeting #topdiv
 - console.log the **position** css property using `.css('position')`
 - console.log the **top** css property using `.position().top`
 - Targeting #wrap
 - console.log the **width** css property using `.width()`
 - Targeting the anchor on the page
 - console.log the **href** attribute using `.attr()`
 - Targeting #username
 - console.log the input value using `.val()`
- **Next, make changes to the document by:**
 - Targeting #topdiv, use `.css({})` to change the *left* property to 200px
 - Targeting #wrap, use `.css({})` to change both width and height to 600px
 - Targeting #email, change the input's value using `.val()`
 - Create a conditional if, checking to see if any of the elements have the "hilite" class, using `.hasClass()`
 - If they don't, use `.addClass()` to give all of them the "hilite" class.
